Fox Ciel is playing a game with numbers now.

Ciel has n positive integers: x_1, x_2, ..., x_n. She can do the following operation as many times as needed: select two different indexes i and $j$such that $x_i > x_j$ hold, and then apply assignment $x_i = x_i - x_j$. The goal is to make the sum of all numbers as small as possible.

Please help Ciel to find this minimal sum.

Input

The first line contains an integer n ($2 \le n \le 100$). Then the second line contains n integers: x_1, x_2, ..., x_n ($1 \le x_i \le 100$).

Output

Output a single integer — the required minimal sum.

```
15
```

Note

In the first example the optimal way is to do the assignment: $x_2 = x_2 - x_1$.

In the second example the optimal sequence of operations is: $x_3 = x_3 - x_2$, $x_2 = x_2 - x_1$.
