B. Gifts Fixing

time limit per test: 1 second

memory limit per test: 256 megabytes

input: standard input

output: standard output

You have n gifts and you want to give all of them to children. Of course, you don't want to offend anyone, so all gifts should be equal between each other. The i -th gift consists of a_i candies and b_i oranges.

During one move, you can choose some gift $1 \leq i \leq n$ and do one of the following operations:

- eat exactly **one candy** from this gift (decrease a_i by one);
- eat exactly **one orange** from this gift (decrease b_i by one);
- eat exactly **one candy** and exactly **one orange** from this gift (decrease both a_i and b_i by one).

Of course, you can not eat a candy or orange if it's not present in the gift (so neither a_i nor b_i can become less than zero).

As said above, all gifts should be equal. This means that after some sequence of moves the following two conditions should be satisfied: $a_1 = a_2 = \dots = a_n$ and $b_1 = b_2 = \dots = b_n$ (and a_i equals b_i is **not necessary**).

Your task is to find the **minimum** number of moves required to equalize all the given gifts.

You have to answer t independent test cases.

Input

The first line of the input contains one integer t ($1 \leq t \leq 1000$) — the number of test cases. Then t test cases follow.

The first line of the test case contains one integer n ($1 \leq n \leq 50$) — the number of gifts. The second line of the test case contains n integers a_1, a_2, \dots, a_n ($1 \leq a_i \leq 10^9$), where a_i is the number of candies in the i -th gift. The third line of the test case contains n integers b_1, b_2, \dots, b_n ($1 \leq b_i \leq 10^9$), where b_i is the number of oranges in the i -th gift.

Output

For each test case, print one integer: the **minimum** number of moves required to equalize all the given gifts.

Example

Note

In the first test case of the example, we can perform the following sequence of moves:

- choose the first gift and eat one orange from it, so $a = [3, 5, 6]$ and $b = [2, 2, 3]$;
- choose the second gift and eat one candy from it, so $a = [3, 4, 6]$ and $b = [2, 2, 3]$;
- choose the second gift and eat one candy from it, so $a = [3, 3, 6]$ and $b = [2, 2, 3]$;
- choose the third gift and eat one candy and one orange from it, so $a = [3, 3, 5]$ and $b = [2, 2, 2]$;
- choose the third gift and eat one candy from it, so $a = [3, 3, 4]$ and $b = [2, 2, 2]$;
- choose the third gift and eat one candy from it, so $a = [3, 3, 3]$ and $b = [2, 2, 2]$.
