Sereja has got an array, consisting of n integers, $a_1, a_2, ..., a_n$. Sereja is an active boy, so he is now going to complete m operations. Each operation will have one of the three forms:

1. Make v_i-th array element equal to x_i. In other words, perform the assignment $a_{v_i} = x_i$.
2. Increase each array element by y_i. In other words, perform n assignments $a_i = a_i + y_i$ $(1 \leq i \leq n)$.
3. Take a piece of paper and write out the q_i-th array element. That is, the element a_{q_i}.

Help Sereja, complete all his operations.

Input

The first line contains integers n, m $(1 \leq n, m \leq 10_5)$. The second line contains n space-separated integers $a_1, a_2, ..., a_n$ $(1 \leq a_i \leq 10_9)$ — the original array.

Next m lines describe operations, the i-th line describes the i-th operation. The first number in the i-th line is integer t_i $(1 \leq t_i \leq 3)$ that represents the operation type. If $t_i = 1$, then it is followed by two integers v_i and x_i, $(1 \leq v_i \leq n, 1 \leq x_i \leq 10_9)$. If $t_i = 2$, then it is followed by integer y_i $(1 \leq y_i \leq 10_4)$. And if $t_i = 3$, then it is followed by integer q_i $(1 \leq q_i \leq n)$.

Output

For each third type operation print value a_{q_i}. Print the values in the order, in which the corresponding queries follow in the input.
